

Lost and Found

Lost and Found application that would give students better chances to find their stuff.

Description

Planning to build a lost and found app that would help people find their lost belongings more easily and faster. The BYU Lost and Found office has its own policies as to how to receive and keep the items, but it would be nicer if someone who finds the item first could upload the info about it (features of the item, where and when it was found, etc.) to a platform where they can interact with the owner of the item. There will be several things to consider about how the items get delivered to the owners smoothly and safely.

Team

Looking for two or three people to join.

Implementation

SQL - MySQL

NoSQL- mongoDB(document database)

BOLTS

Business

The end users will primarily be BYU students. The application will be free to use. The goal is to include the app in the BYU app.

Operation

Once the app acquires enough users and there are enough successful cases, we are going to suggest the Lost and Found office to consider utilizing the app by integrating the app with the BYU app. If it is accepted, it will be run by BYU.

Legal

The app will belong to BYU if approved and accepted by the university.

Technical

1. Determine the policies about the process of how the found items get delivered to the owners.
2. Choose a platform and which databases to use.
3. Choose programming languages to use.

Social

Advertise the app possibly with the aid of the Lost and Found office.
